

## Additional Information About SpectraVision

The SpectraVision's evaluation process scans for stressful influences of toxic substances. Some of the numerous testing categories are airborne allergies, bacteria, food allergies, viruses, parasites, yeast, mold, fungus, dental materials, hormones, chemicals, vaccination toxicity, environmental and industrial pollution, pesticides, metals and many more. Each substance within the selected list of categories is then Bio-feedback tested against the body's electrical system.

SpectraVision Biofeedback also scans and tests for beneficial substances such as vitamins, minerals, herbs, flower remedies, essential oils, herbs and homeopathic remedies. It discovers the irritants within the body and tests to find remedies to help restore health.

The testing and the responses are recorded within the computer and the reactions will provide Dr. Harris with what is known as a "galvanic skin response" to the testing of the body's organ systems.

It's important to note the amount of current is so minuscule you feel nothing as it is happening. You can even view the responses to the test on the computer screen.

This SpectraVision Biofeedback scanning technology can help determine strategies to deal with an array of different health challenges.
